Correlated Dirac eigenvalues and axial anomaly in chiral symmetric QCD

понедельник, 9 ноября 2020 г. 13:00 (30)

In this talk I will present our very recent work based on [1].
We introduce novel relations between the derivatives ($\partial^n \rho(\lambda, m_l)/\partial m_l^n$) of the Dirac eigenvalue spectrum ($\rho(\lambda, m_l)$) with respect to the light sea quark mass (m_l) and the $(n+1)$-point correlations among the eigenvalues (λ) of the massless Dirac operator. Using these relations we present lattice QCD results for $\partial^n \rho(\lambda, m_l)/\partial m_l^n$ ($n = 1, 2, 3$) for m_l corresponding to pion masses $m_\pi = 160 - 55$ MeV, and at a temperature of about 1.6 times the chiral phase transition temperature. Calculations were carried out using (2+1)-flavors of highly improved staggered quarks with the physical value of strange quark mass, three lattice spacings $a = 0.12, 0.08, 0.06$ fm, and lattices having aspect ratios $4 - 9$. We find that $\rho(\lambda \to 0, m_l)$ develops a peaked structure. This peaked structure arises due to non-Poisson correlations within the infrared part of the Dirac eigenvalue spectrum, becomes sharper as $a \to 0$, and its amplitude is proportional to m_l^2. We demonstrate that this $\rho(\lambda \to 0, m_l)$ is responsible for the manifestations of axial anomaly in 2-point correlation functions of light scalar and pseudo-scalar mesons. After continuum and chiral extrapolations we find that axial anomaly remains manifested in 2-point correlation functions of scalar and pseudo-scalar mesons in the chiral limit.
