

RG Equations in Non-renormalizable Theories

Thursday, November 24, 2022 9:40 AM (40 minutes)

We construct the RG equations for the scattering amplitudes and effective potential in a set of non-renormalizable theories. We show that they are a consequence of locality rather than multiplicative renormalizability. These RG equations sum up the leading log terms in all orders of PT and allow one to explore the high energy/field behaviour.
